1. Crea una red bridge redbd

```
docker network create redbd
docker network inspect redbd
```

```

sergio@sergio-VirtualBox:~$ docker network inspect redbd

Apartado 2

Crea un contenedor con una imagen de mariadb que estará en la red redbd . Este contenedor se ejecutará en segundo plano, y será accesible a través del puerto 3306. (Es necesario definir la contraseña del usuario root y un volumen de datos persistente)

```

docker run -d --name contenedormariadb --network redbd -e MYSQL_ROOT_PASSWORD=root -p 8000:3306 mariadb

```

```

sergio@sergio-VirtualBox:~$ docker run -d --name contenedormariadb --network redbd -e MYSQL_ROOT_PASSWORD=root -p 8000:3306 mariadb

sergio@sergio-VirtualBox:~$ docker ps -a

```

Apartado 3 y 4

Crear un contenedor con Adminer que se pueda conectar al contenedor de la BD. Comprobar que el contenedor Adminer puede conectar con el contenedor mysql abriendo un navegador web y accediendo a la URL: <http://localhost:8080>

```

docker run -d --name contenedoradminer --network redbd -p 8080:8080 adminer

```

```
docker exec -it contenedormariadb bash
mysql -u root -p
show databases;
```

```
sergio@sergio-VirtualBox:~$ docker exec -it contenedormariadb bash
root@0aba2cb0edd6:/# mysql -u root -p
